

How I Learned to Stop Worrying and Love the R Console

Irfan Kanat
Department of Information Systems
Arizona State University

November 4, 2015

Outline

- 1 Introduction
 - Familiar Examples
- 2 R Console
- 3 Importing Data
- 4 Packages
- 5 Sample Analysis and Visualizations
 - Descriptive Visualizations
 - Modeling
- 6 Reporting
- 7 Where to Go Next?

Who am I?

Irfan Kanat, PhD Candidate

R user since 2006

Open Source Evangelist

Before We Begin

Got R & R Studio Installed?

Get your workshop documents:

<https://github.com/iekanat/rworkshop>

What is this about?

A brief introduction to R.

- R Console
- Importing Data
- Packages
- Sample analyses
- Basic visualization
- Where to get help?

What is R?

From R project web site:

R is a language *and* an environment for statistical computing and graphics.

- Language
- Environment
- Statistics and Visualization

What is R?

All this means R is very flexible, which played a huge role in its success.

My take: Low cost, high quality, open source solution for your analysis needs.

When to Use R?

R is very strong for your classical machine learning and statistical analysis. Thousands of packages address almost all analysis needs. It is a logical first step to start analysis.

When to Use R?

R is very strong for your classical machine learning and statistical analysis. Thousands of packages address almost all analysis needs. It is a logical first step to start analysis.

Yet it's core design is starting to show its age. There are certain down sides to traditional R:

- Everything is stored in memory¹
- R is single core¹

¹Except when it is not. There are packages to overcome these issues.

Best Part of R

Packages CRAN houses over 7K packages. Providing functionality way beyond what is available in commercial packages.

Community Millions of users mean, all your questions are either already answered or will be in hours.

Performance While memory and core restrictions are real, for the cost of a single user license of a commercial package, you can buy better hardware to run R. Furthermore, with the packages providing multicore and flatfile functionality, R performance is on par or better than commercial packages

Logistic Regression

```
# Fit the model
logit_0 <- glm(admit ~ ., admitData, family = "binomial")
# Display fitted model
summary(logit_0)
```

```
##
## Call:
## glm(formula = admit ~ ., family = "binomial", data = admitData)
##
## Deviance Residuals:
##      Min       1Q   Median       3Q      Max
## -1.6268  -0.8662  -0.6388   1.1490   2.0790
##
## Coefficients:
##              Estimate Std. Error z value Pr(>|z|)
## (Intercept) -3.989979   1.139951  -3.500  0.000465 ***
## gre          0.002264   0.001094   2.070  0.038465 *
## gpa          0.804038   0.331819   2.423  0.015388 *
## rank2       -0.675443   0.316490  -2.134  0.032829 *
## rank3       -1.340204   0.345306  -3.881  0.000104 ***
## rank4       -1.551464   0.417832  -3.713  0.000205 ***
## ---
```

Logistic Regression

```
ggplot(admitData, aes(x = gre, y = admit)) + geom_point(aes(colour = rank)) +  
  stat_smooth(method = "glm", family = "binomial", se = T)
```

Support Vector Machine

```
# Fit the model  
svm_0 <- svm(admit ~ ., data = admitData, type = "C-classification")  
# Plot the results  
plot(svm_0, admitData, gre ~ gpa) # Let us plot the results
```

R Studio

The screenshot displays the R Studio interface with four main panels:

- Source Editor (Top Left):** Contains an R script. A red box labeled 'A' highlights the first chunk of code, which includes a comment about saving the project and a function definition for 'get_wet'.
- Environment (Top Right):** Shows the current environment with variables like 'admtData', 'csv', 'd', 'xLsx', and 'values'. A blue box labeled 'C' highlights the 'values' variable, which is a list of 30 elements.
- Console (Bottom Left):** Shows the output of the R script. A green box labeled 'B' highlights the console output, which includes the results of the 'svm' function and the 'plot' function.
- Plots (Bottom Right):** Displays an 'SVM classification plot' showing data points (x and o) classified into two groups (0 and 1) based on 'gpa' and 'gre' scores. A yellow box labeled 'D' highlights a specific region of the plot.

Loops in R

CAUTION!

R is notoriously inefficient with your classic loops

- Structure of the Data Frame
- Memory Management

Try to use an apply function instead.

Vectorize your operations.

For Loop in R

```
for (i in 1:3) print(i)

## [1] 1
## [1] 2
## [1] 3

# Iterating through a data frame
for (i in 1:nrow(Countries)) {
  print(Countries[i, ])
}

##      names supply those
## 1      US      10  TRUE
##      names supply those
## 2      TR       8 FALSE
##      names supply those
## 3      DE       7 FALSE
```

Functions I

```
mean(C)  # Takes parameters
```

```
## [1] 5
```

```
mean(C, trim = 0.1, na.rm = T)  # Takes multiple parameters
```

```
## [1] 5
```

```
log(sum(C)/length(C))  # Can be combined
```

```
## [1] 1.609438
```

Functions II

```
HelloWorld <- function(x, y = 1) {  
  for (i in 1:y) {  
    print(paste("Hello", x))  
  }  
}
```

```
HelloWorld("MSBA")
```

```
## [1] "Hello MSBA"
```

```
HelloWorld("MSBA", 2)
```

```
## [1] "Hello MSBA"
```

```
## [1] "Hello MSBA"
```

Functions III

```
HelloWorld  # Review the source code
```

```
## function(x, y = 1) {  
##   for (i in 1:y) {  
##     print(paste("Hello", x))  
##   }  
## }
```

```
ls
```

```
## function (name, pos = -1L, envir = as.environment(pos), all.names = FALSE,  
##   pattern, sorted = TRUE)  
## {  
##   if (!missing(name)) {  
##     pos <- tryCatch(name, error = function(e) e)  
##     if (inherits(pos, "error")) {  
##       name <- substitute(name)  
##       if (!is.character(name))  
##         name <- deparse(name)  
##       warning(gettextf("%s converted to character string",  
##         sQuote(name)), domain = NA)  
##       pos <- name
```

Commonly Used Functions I

```
ls() # Get a list of objects in the workspace

## [1] "A"          "admitData"  "B"          "C"          "Countries"
## [6] "HelloWorld" "i"          "logit_0"    "svm_0"
```

```
ls(pattern = "*_0") # partial match on object search

## [1] "logit_0" "svm_0"
```

```
rm("svm_0") # Remove an object from the workspace

# rm(list=ls(pattern=ls())) # This would remove everything if ran
```

Commonly Used Functions II

```
mean(A)  # Mean  
## [1] 2  
  
sd(admitData[, "gre"])  # Standard Deviation  
## [1] 115.5165

Questions

Outline

- 1 Introduction
 - Familiar Examples
- 2 R Console
- 3 Importing Data**
- 4 Packages
- 5 Sample Analysis and Visualizations
 - Descriptive Visualizations
 - Modeling
- 6 Reporting
- 7 Where to Go Next?

Importing Data

R allows importing data from a wide variety of sources.

- Comma Separated Values (CSV)
- Databases
- Flat files
- Lesser statistical packages
- and more

Importing CSV Files

CSV has certain advantages that make it popular.

- Compatibility
- Flexibility
- Simplicity

Sample

```
"iso2", "Supply", "Those"  
"AU", 20, 0  
"TR", 80, 1  
"US", 100, 0  
"GB", 50, 0  
"DE", 70, 0
```

We use `read.csv()` or `read.csv2()` commands to import the csv files.

```
saveData <- read.csv("PathToCSV", header = TRUE, sep = ",", quote = "\"", )
```

Working with Excel Files

Much like CSV, except it lacks the simplicity, flexibility, and compatibility of CSV.

```
# Load the necessary library  
library(xlsx)  
# Read in the data from excel file  
xlsx <- read.xlsx("country.xlsx", sheetIndex = 1)
```

Working with Databases

No speed advantage.

Data larger than memory.

Working with databases:

- Work in the database.
- Import data from database.

Working with Databases

```
# Load the necessary library
library(RMySQL)
# Establish connection to the database.
channel <- dbConnect(MySQL(), user = "uname", password = "pwd", host = "127.0.0.1",
  dbname = "exampledata")
# Send query and save results in R workspace
sql <- dbGetQuery(channel, "SELECT * FROM table;")
```

Lesser Statistical Packages :P

Foreign Package

Newer file formats

- sas7bdat
- readstata13

Packages: Source of R's Power

Encountered already

Make R extendible

Like libraries

Collection of:

- functions
- documentation
- data files

Gifts from the Community

Currently over 7000 packages

for

- Statistical Modeling
- Machine Learning
- Data Manipulation
- Visualization
- ...

from

- Economics
- Computer Science
- Statistics
- Medicine
- ...

Great but Where are My Gifts?

Comprehensive R Archive Network (CRAN)

A Group of FTP and HTML servers hosting R packages.

R has built in package management facilities.

Most of these can be achieved through the R Studio GUI. (Area D, packages pane)

Package Management

```
# Installing a package
install.packages("e1071") # Notice the quotes around package name
# Loading package into memory
library(e1071) # Notice the lack of quotes
# Unload package
detach("package:e1071", unload = TRUE) # Notice the package: prepended

# Get the list of packages loaded
(.packages())
# Get list of all installed packages (output omitted)
.packages(all.available = T)
```

How to Find Packages

If you want to search a certain word in installed packages' documentation, you can always use `??` or `help.search()`

```
??mixed  
help.search("mixed model")
```

Internet searches are a bit problematic as R can be a bit ambiguous until Google learns you are interested in the statistical computing environment.

Comprehensive R Archive Network (CRAN)

R Forge

R site search also available with command `RSiteSearch()`

R seek

Commonly Used Packages: Data Manipulation

data.tables Replaces traditional `data.frame`.

- Faster access/write
- Improved selection
- Improved subsetting
- Improved aggregation

Not a drop-in replacement as it breaks compatibility in some cases.

ddplyr

Additional functionality for:

- selection
- filtering
- aggregation

Provides efficient back-end data structures to speed things up.

Works with databases as well.

Commonly Used Packages: Statistics

Multiple Regression: Stats package, `lm()` (loaded by default)

Generalized Linear Models: Stats package, `glm()`

Traditional Econometric Models: `plm` package

Mixed Modeling: `nlme` and `lme4` packages

Commonly Used Packages: Machine Learning

Most probably all you need is caret package.

Caret package is a wrapper for a host of classification and regression model training functions. It eases visualizations, data manipulation, and analytics among others. **It currently supports over 150 types of models.**

If you insist on using individual packages:

Classifiers: class package

Support Vector Machines: kernlab, e1071 packages

Clustering: Base package (kmeans(), hclust()), mclust package

Neural Networks: neuralnet package.

Motor Trends Dataset

We will use 1974 Motor Trend dataset. It has 32 observations and 11 variables.

- mpg: Miles per gallon
- cyl: Number of cylinders
- disp: Displacement
- hp: Horse Power
- drat: Rear axle ratio
- wt: Weight
- qsec: quarter mile time
- vs: V - S
- am: 0 automatic, 1 manual
- gear: Gears
- carb: Number of carburetors

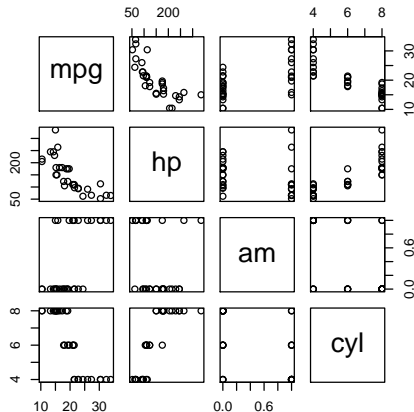

Motor Trends Dataset I

```
summary(mtcars)
```

```

##  Max.   :1.0000   Max.   :5.000   Max.   :8.000
```

Motor Trends Dataset II

```
pairs(mtcars[, c("mpg", "hp", "am", "cyl")]) # Visualize Correlations
```

Histograms I

```
data(mtcars) # Load the Dataset
library(ggplot2) # Load the ggplot package
# Nr of cars by number of gears
qplot(factor(gear), data = mtcars, geom = "bar")
```

Histograms II

```
# If we are interested in a third categorical variable vs:  
qplot(factor(gear), data=mtcars, geom="bar", fill=factor(am)) +  
ggtitle('Nice Histogram') # This is how you add a title
```

Scatter Plots I

```
# Two continuous variables
```

```
qplot(hp, mpg, data = mtcars, color = factor(cyl))
```

Scatter Plots II

```
# Add two more variables represented by color and size of points  
qplot(hp, mpg, data = mtcars, color = factor(cyl), size = disp, alpha = 0.09)
```

Scatter Plots III

```
ggplot(mtcars, aes(x = hp, y = mpg)) + geom_point(aes(color = factor(cyl))) +  
  # Add a regression line  
  geom_smooth(method = lm)
```

Bar Charts I

```
ggplot(mtcars, aes(x = factor(gear), y = mpg, fill = factor(vs)), color = factor(vs))  
  stat_summary(fun.y = mean, position = position_dodge(), geom = "bar")
```

Multiple Regression

We will keep using motor trends data set.

Pay close attention to how we specify the model.

Formula

$$Y = \beta_0 + \beta_1 x_1 + \beta_2 x_2 + \epsilon$$

R Model

$$Y \sim x_1 + x_2$$

This basic structure will remain constant across many R packages.

Regression I

```
# Let us estimate gas milage
reg_0 <- lm(mpg ~ hp + cyl + am, mtcars)
summary(reg_0)

##
## Call:
## lm(formula = mpg ~ hp + cyl + am, data = mtcars)
##
## Residuals:
##      Min       1Q   Median       3Q      Max
## -4.864 -1.811 -0.158  1.492  6.013
##
## Coefficients:
##              Estimate Std. Error t value Pr(>|t|)
## (Intercept)  30.88834    2.78422   11.094 9.27e-12 ***
## hp          -0.03688    0.01452   -2.540  0.01693 *
## cyl         -1.12721    0.63417   -1.777  0.08636 .
## am           3.90428    1.29659    3.011  0.00546 **
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 2.807 on 28 degrees of freedom

```

Logistic Regression

Dependent variable will be type (binary).

It is basically a regression with a binomial link function.

Formula

$$\log \left(\frac{p}{1-p} \right) = \beta_0 + \beta_1 x_1 + \epsilon$$

Logit I

```
logit_2 <- glm(am ~ mpg + drat + cyl, data = mtcars, family = "binomial")
summary(logit_2)
```

```
##
## Call:
## glm(formula = am ~ mpg + drat + cyl, family = "binomial", data = mtcars)
##
## Deviance Residuals:
##      Min       1Q   Median       3Q      Max
## -1.58367  -0.31020  -0.03757   0.17972   1.75395
##
## Coefficients:
##              Estimate Std. Error z value Pr(>|z|)
## (Intercept)  -49.4548    24.1280  -2.050   0.0404 *
## mpg           0.6378     0.4266   1.495   0.1349
## drat          7.2595     3.2702   2.220   0.0264 *

```

Caret Package

The Caret package is a wrapper that combines functionality from 27 R packages.

Functions Provided:

- Visualization
- Data Manipulation
- Model Training & Selection
- Parallel Processing

Since so many packages involved, the installation takes a while.

```
install.packages("caret", dependencies = c("Depends", "Suggests"))
```

For this part of the exercise I will focus on Caret Package, following its [vignette](#).

Data Splitting I

```
## OBTAIN DATASET Dataset comes with mlbench package
library(mlbench)
# Load dataset into the current workspace
data(Sonar)
# 208 observations and 61 variables
```

```
## SPLIT THE DATA

# caret provides functionality
library(caret)
# Set random number seed for reproducibility
set.seed(107)
# Create an index of observations to be included in Training
indexTrain <- createDataPartition(y = Sonar$Class, p = 0.75, list = FALSE)

# $plit the data using the index
Train <- Sonar[indexTrain, ]
Test <- Sonar[-indexTrain, ]
```

Train a PLS Discriminant Model I

```
## Declare Tuning Control Parameters
ctrl <- trainControl(method = "repeatedcv", # K-fold cross validation
                     repeats = 3, # Repeat resampling 3 times
                     classProbs = TRUE, # Calculate predicted prob for ROC
                     summaryFunction = twoClassSummary) # Set performance metrics for

## Train the Classifier
plsFit <- train(Class ~ ., data = Train, method = "pls",
               tuneLength = 10, # Number of component sets to be evaluated (more
               trControl = ctrl, # Use control parameters from above
               metric = "ROC", # Criteria ROC
               preProc = c("center", "scale")) # Center and scale the predictors
```

Train a PLS Discriminant Model II

```
plsFit
```

```
## Partial Least Squares
##
## 157 samples
## 60 predictors
## 2 classes: 'M', 'R'
##
## Pre-processing: centered (60), scaled (60)
## Resampling: Cross-Validated (10 fold, repeated 3 times)
## Summary of sample sizes: 142, 141, 142, 142, 142, 142, ...
## Resampling results across tuning parameters:
##
##      ncomp  ROC      Sens      Spec      ROC SD      Sens SD      Spec SD

##
## ROC was used to select the optimal model using the largest value.
## The final value used for the model was ncomp = 4.
```

Train a PLS Discriminant Model III

```
# evaluate the performance of different number of components extracted  
plot(plsFit)
```

Validate with Test Data I

```
plsPredict <- predict(plsFit, newdata = Test) # Predict results  
head(plsPredict) # View predictions
```

```
## [1] R M M R M R  
## Levels: M R
```

```
head(Test$Class) # View actual$
```

```
## [1] R R R R R R  
## Levels: M R
```

Validate with Test Data II

```
# Get confusion matrix (predicted vs actual)
confusionMatrix(data = plsPredict, Test$class) ##

Professional Looking Documents

All the documentation of this workshop has been prepared in R Studio.

Look into the Rmd documents to see how this was done.

`summary()` function does not provide the best looking model summaries.
Try the `texreg` package (do as I say, not as I do).

Quo Vadis?

8 hours is not enough!

RTFM²: Documentation is your friend, read the vignettes and manuals.

For tutorials: [Institute For Digital Research and Education, UCLA](#)

For questions: StackExchange³

- [Cross Validated](#) specializes on Statistics
- [Stack Overflow](#) for R programming

R Programming is quirky, learn about efficient R programming.

²Read the Friendly Manual

³Word of caution, [pay attention to how you ask your questions](#). It is more important than you realize.
